combating Babesia canis infections

Claim 2; Fig 3; 41pp; English.

New isolated antigenic peptides e.g., for G protein-coupled receptors (GPCR), useful for diagnosing and designing drugs for treating conditions in which GPCRs are involved, e.g. AIDS, Alzheimer's disease, cancer or autoimmune diseases

Claim 1; Fig 2; 523pp; English.

The present invention describes a Babesia canis associated protein (I), comprising a Bcvirl5 protein of 15 kD molecular weight (MW) and having a sequence of at least 80% homology to a sequence (ABP53714) of 141 amino acids, or a Bcvirl3 protein of 32 kD WW and having a sequence of at least 80% homology to a sequence (ABP53715) of 285 amino acids, or their immunogenic fragments. (I) have antiparasitic and immunostimulant activities, and can be used in vaccines. (I) can also be used for the preparation of a vaccine for combating B. canis infections. (I) is also useful in a diagnostic test for the detection of antibodies against B. canis associated antigenic material. The present sequence represents

The present invention describes antigenic peptides (I) comprising:

(a) any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino cards. Also described: (I) an assay for the detection of a particular gradies of protein-coupled receptor (GPCR) or a candidate polypeptide in a sample; and (2) an isolated antibody having high specificity and high affinity or a validity for a particular GPCR. (I) can be used as GPCR modulators and in gene therapy. The antigenic peptides for GPCRs are useful in detecting an antibody against a particular GPCR, and in the production of specific an antibodies. The peptides and antibodies are also useful for detecting the presence or absence of corresponding GPCRs. The antigenic peptides for GPCRs and antibodies are useful for diagnosing and designing the presence or absence of corresponding GPCRs. The antigenic peptides for GPCRs and antibodies are useful for diagnosing and designing drugs for regeneration-related disease, immunological-related disease, cell reating immune-related diseases, immunological-related disease, collisease, atherosclerosis, bacterial, fungal, protozoan or viral infections, osteoarthritis, osteoprocesis, cancer, cardiomyopathy, chronic and acute inflammation, allergies, Crohn's disease, quibbetes, graft versus host disease, parkinson's disease, multiple sclerosis, pain, psoriasis, canxety, depression, schizophrenia, dementia, mental retardation, memory closs, epilepsy, aschma, tuberculosis, obseity, nausea, hypertension, hypotension, renal disorders, rheumatoid arthritis, trauma, ulcers, or cany other disorders in which GPCRs are involved. The antibodies may be used in immunoassays and immunodiagnosis ABE24553 to ABE242869 encode exemplification of the present involved. The antibodies may be exemplification of the present involved. The autibodies may be compared to the present involved. The autibodies may be compared to the present invention.

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by the creatment, prevention and diagnosis of medical conditions caused by practices. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. The acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the nervous considered with acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and entermining the amount of bound protein in the sample. The oplypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to therefore treat P acnes infections. The antibodies and charmostaliate expression and activity of P. acnes polypeptides and dagnostic agents for determining P. acnes presence, for example, by chargonic in a sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO XXX at the proposition of antibodies and specification, but was obtained in electronic format directly from WIPO XXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; immune; haematopoietic; immune/haematopoietic antigen; cancer; cytostatic; gene therapy; vaccine; metastasis.

treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased texpression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polymucleotides may be used to produce the secreted (I), by inscrting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polymucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially anchore metastases of haematopoietic-derived cells. AAK64703 to AAR87694 represent human immune/haematopoietic antien genomic sequences from the present invention. AAK64922 to AAK54950 and AAM82169 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperproliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; mimune deficiency; immune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis; myasthenia gravis.

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABN15762 to ABN27252 encode the human ORFX proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated
                                                                                                                                                                                                                                         Novel human polypeptides and polynucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and autoimmune disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; SEQ ID 19052; 1037pp; English

AAKS4951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -

disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORTX-associated disorder. ORTX polymucleotide sequences can be used in gene therapy. ORTX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage, osteoarthitis, neurodegenerative disorders, disorders, haemorrhage, transplantation, cardiovascular diseases, diabetes mellitus, systemic atorage disease, usrious immune disorders multiple solerosis, rheumatoid arthritis, autoimmune thyroidisingencies and disorders, infectious diseases, autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. Ost proteins are also useful for treating burns, inclains, ulcers, for treating osteoporosis, pone degenerative disorders or periodontal disease, and for gut protection or regeneration and treatment of lung or liver fibrosis, repertusion injury in various tissues and conditions resulting from systemic cytokine damage.

When the sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO.

                                                                                                                                                                         Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
          production of other cytokines in other cell populations. The population of other cytokines in other cell populations. The polymucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoises regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel human polypeptides and polynucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and disorders related to organ transplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequences ABP31028-ABP35561 represent 4534 novel human proteins

Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris -

Example 1; SEQ ID No 3103; 1069pp; English

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, pervention and diagnosis of medical conditions caused by c. p. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. The acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the correct or absence of P. acnes in a partient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies can be used as diagnostic agents for determining P. acnes presence, for example, by construct inkeed immunosorbent assay (EUISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO construction, but was obtained in electronic format directly from WIPO constructs.

New elongase gene extends 16, 18 and 20 carbon fatty acids, useful manipulate plants to produce polyunsaturated fatty acids for the foodstuffs, cosmetics and pharmaceutical industries

Claim 2c; Page 129-130; 135pp; German.

This invention describes a novel isolated nucleic acid from a plant or algae which encodes a polypeptide which extends a C_1_6, C_1_8 or C_2_0 fatty acid having at least two double bonds by at least two Carbon atoms. The products of the invention can be used to produce polyunsaturated fatty acids (PUFAs) in the form of oils, lipids or fatty acids in a method which comprises breeding organisms e.g. transgenic plants containing the above nucleic acids, constructs or vectors encoding a polypeptide which extends a C_1_6, C_1_8 or C_2 0 fatty acid having at least two double bonds by at least two carbon atoms, under PUFA forming conditions. The oils, lipids or fatty acid compositions produced by the invention are used in fodder, food, cosmetics and pharmaccuticals. The invention is more efficient at producing polyunsaturated fatty acids in a broad spectrum of plants than prior art. This sequence represents the Crypthecodinium sp. elongase protein isolated from clone Cc_PSEI which is described in the method of the invention.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, and for chromosome and gene mapping, and in recombinant production of (II). The cardian response is a sexpressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques for restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical ingior of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in disorders for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic amino acid sequences. Abgololo-Abg3077 represent novel human diagnostic amino acid sequences of the invention.

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, or polypeptides against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may have various activities, including cytokine, cell prolletation or cell differentiation activities; stem cell growth factor activity, mannewaltery activity; tissue growth activity; immnomodulatory activity; tissue growth activities; chemotactic or chemokinetic activities; haemostatic, thrombotic or thrombolytic activities; activit or ligand activities; or may be Human; cytokine; cell proliferation; cell differentiation; growth, immunoadollator; activin; inhibin; chemotaxis; chemokinesis; thrombolysis; oncogenesis; proliferation; metastasis; chemokinesis; thrombolysis; oncogenesis; proliferation; metastasis; cancer; thrombolysis; oncogenesis; proliferation; metastasis; cancer; thrombolysis; asthma; arthritis; chronic inflammatory condition; proliferative retinopathy; atherosclerosis; coronary heart disease; arterial ischaemia; bone discorder; osteoporosis; vascular growth discorder; partial condition; proliferative regeneration; wound healing; infection; immune discret; cell culture; drug screening; gene therapy; antiinflammatory; coll culture; drug screening; gene therapy; antiinflammatory; cytostatic; osteopathic; vasotropic; cardiant; virucide; antibacterial; antifungal; vulnerary; antiulcer. conditions, each biological activities, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell disorders) chronic inflammatory conditions (e.g., myeloid or lymphoid cell disorders), chronic inflammatory conditions (e.g., asthma or arthritis), croliferative retinopathy, atherosclerosis, coronary heart disease, arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal vascular growth. Polypeptides involved with tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound creating (e.g., of burns, inclisions and ulcers), while those with immunomodulatory activities may be used in the treatment of viral, bacterial and fungal infections in addition to immune disorders.

Communomodulates stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides can ave also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a novel human con polypeptide of the invention.

The invention relates to human nucleic acids (AAIS7798-AAI61169) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostaric activity. The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous system as peripheral nervous system diseases, such as localised neuropathies and central nervous system diseases, such as lathermer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the cutilisation of the activity, chemotactic/chemokinetic activity, haemostatic activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, chemotactic/chemokinetic activity, haemostatic assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Novel nucleic acids and polypeptides, useful for treating disorders such as central nervous system injuries -Example 2; SEQ ID NO 6579; 10078pp; English specification.

Selectively labeled membrane peptides, useful e.g. for detecting ligand binding to receptors and in drug screening, are prepared, in lipid matrix, by reaction between amino acid residues

Example 11; Page 70; 120pp; English

New methods are described by which membrane polypeptides can be labelled. The method comprises chemosplective chemical ligation of the membrane polypeptide which is incorporated in a lipid matrix, and a ligation label. Both contain an amino acid having an an alignous and a ligation to form a covalent together undergo chemoselective comprehenced reactive group that together undergo chemoselective ligation to form a covalent bond. The method can be used to label collaborate sembedded in a lipid membrane, by treating the polypeptide with an unprotected reactive group and then ligating the cleaved polypeptide with the ligation label. The ligation label can be a chromophore, thus ligand binding to membrane bound polypeptides can be detected by contacting a membrane bound polypeptides can be detected by contacting a membrane bound polypeptides can be detected by contacting a membrane bound polypeptides can be detected by contacting a membrane bound polypeptides can be detected by contacting a membrane bound polypeptides can be detected by contacting a membrane bound polypeptides can comprose, the chromophore and a second can energy transfer system. The methods are used for lipid matrix assisted chemical ligation and systems of previously transfer system. The methods are used to detect ligand binding and the identification of receptor domains, e.g. for selection or design, and for diagnosis. The methods are particularly selection and activity studies. They can also be used in drug screening, selection or design, and for diagnosis. The methods are particularly selection or design, and for diagnosis. The method allows and analysis of previously inaccessible membrane polypeptides. Catevage product can an analysis of previously inaccessible membrane proteins. A method allows and analysis of previously inaccessible membrane proteins.

Site (AAY83182) and this MC4 receptor membrane polypeptide synthesic labeled can MC4 ligation label produces the synthetic labeled can MC4 ligation label produces the synthetic labeled can MC methods are described by which membrane polypeptides can be

Chemoselective chemical ligation of membrane polypeptides useful for assaying ligand binding to membrane polypeptides, involves covalently binding polypeptides incorporated in a lipid matrix with ligation labels

Example 11; Column 48; 52pp; English.

The invention relates to chemoselective chemical ligation (CCL) of a membrane polypeptide, (M1) involves contacting (under CCL conditions):

(a) polypeptide (T) incorporated in lipid matrix, comprising first amino acid (A1) having unprotected reactive group; (b) with ligation label (II) comprising second amino acid (A2) having unprotected reactive group; (b) with ligation corporated in a lipid matrix and at least on non-naturally and A2). Also included are a composition comprising an integral membrane polypeptide embedded in a lipid matrix and at least one non-naturally occurring amino acid comprising a unprotected reactive group; and a composition comprising a membrane polypeptide has at least two amino acid residues composition comprising a membrane polypeptide has at least two amino acid residues composition comprising a membrane polypeptide has at least two amino acid residues composition comprising a non-natural backbone bond). The mentod is useful for chemoselective chemical ligation of a folded membrane polypeptide has at lass two amino acid residues composition comprising a non-natural backbone bond). The method is particularly useful for indirectly interactly interactly with a folded compounds for drug development, and other structural and functional assays, that employ binding of a ligand to a pre-folded membrane polypeptides and domains comprising a receptor, and thus are compounds for drug development, and other structural and diagnostics, error methods and compositions are compounds enting/selection/design and diagnostics, error individes of cassays that employ binding of a ligand to a pre-folded membrane polypeptides and domains comprising a receptor, and thus are extremely useful for structure/function studies, drug creening/selection/design and diagnostics, error individual applications. The methods and compositions are particularly suited for fluorescence resonance energy transfer (FEET) analyses of previously inaccessible membrane polypeptides the melanocortin receptor.                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                       The invention relates to a method for identifying an animal having a genotype that indicates good meat quality traits such as drip loss, marbling, pH and colour. This involves assaying a nucleic acid for a polymorphism in the melanocortin-4 receptor (WG4R) gene, which is associated with meat quality traits in animals. Assaying for the presence of at least one genetic marker at this gene region allows genetic evaluation. The method is used to identify meat producing animals, such as pigs, cows, sheep and chickens, with favourable meat quality traits, particularly to select animals for breeding and to ensure uniformity at slaughter. This sequence represents the human melanocortin-4 receptor. Note: The specification states that this protein is encoded by the DNA sequence featured in AAS14759.
                                                                                                                                            Identifying genotype associated with good meat quality, useful e.g. for selecting animals for breeding, by detecting a polymorphism in the melanocortin-4 receptor gene -

as affecting behaviour, learning, memory, control of the cardiovascular system, analgesia, thermoregulation and the release of other neurohumoral agents (such as prolatin and biogenic animes). The nucleic acids can be used to transfect mammalian cells lacking endogenous MC receptors to induce their expression. These sequences can also be used to screen and identify drugs which specifically react with MCRs on the surface of a cell. The drugs can then be used for treating diseases which have MCRs implicated as one of their causes. Vectors containing these sequences can also be used to treat the diseases. 888888888888888

Gantz I, Yamada T;

DNA encoding melanocortin-5 receptor - useful in hybridisation assays for melanocortin-5 receptor nucleic acids

The present sequence represents the human melanocortin-4 (MC4) receptor, the gene of which has been localised to chromosome 18q21.3. This receptor is activated by both the amino and carboxyl terminal end amino acids of melanocortins and has been found to be expressed primarily in the brain and is absent from in the adrenal cortex, melanocytes and blacenta. The DNA sequence that produces this polypeptide was identified by using oligonucleotides constructed from previously identified receptors MC1 and MC3, this was performed by using these oligonucleotides genes and their products may be used to previous family. These genes and their products may be used to provide therapeutic vehicles for the treatment of processes involving the function of melanocortin

Chen W, Cone RD, Fan W, Kesterton RA; Boston BA,

ľu D;

This is the amino acid sequence of the human melanocortin-4 receptor (MCR-4). The MCR agonists and antagonists can be used for modifying feeding behaviour in an animal. The artagonists can be used for stimulating feeding while the agonists can be used for inhibiting feeding. They can be used for the treatment of eating disorders such as anorexia and obesity, and other pathological weight and eating-related disorders. They can also be used to treat failure to thrive disorders and disease-related cachexia, such as occurs in cancer patients, as well as other metabolic disorders.

```
The sequence is that of a mutant melanocortin 4 receptor (MC4-R), the mutation is the Ile137Thr mutation. The sequence can be used in the generation of drug screening assays to identify compounds which could be used in the treatment of body weight disorders e.g. obesity, anorexia and cachexia. Specific compounds include agonists or antibodies that and cachexite the MC4-R to induce weight loss, an antibody or extracelluar domain of the MC4-R that inhibits MC4-R activation and therefore induces weight gain or an oligonucleotide that inhibits translation by encoding an antisense or ribozyme molecule that targets MC4-R transcripts or by forming a triple helix with the MC4-R gene "Dromoteer to induce weight gain." (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Drug screening assays to identify compounds for body weight disorder treatment - e.g. obesity, anorexia and cachexia, using melanocortin 4 receptor as target

Drug screening assays to identify compounds for body weight disorder treatment - e.g. obesity, anorexia and cachexia, using melanocortin 4 receptor as target

Melanocortin 4 receptor; MC4-R gene; body weight disorder; treatment; obesity; anorexia; cachexia; Vall021le; mutant.

102..102 /note= "Vall021le mutation from wild-type"

                                                                                                                                                                                                                                                                                                                                                                                                     The sequence is that of a mutant melanocortin 4 receptor (MC4-R), the mutation is the Val10211e mutation. The sequence can be used in the generation of drug screening assays to identify compounds which could be used in the treatment of body weight drockers e.g. obseity, anorexia and cachexia. Specific compounds include agonists or antibodies that bind and activate the MC4-R to induce weight loss, an antibody or extracelluar domain of the MC4-R that inhibits MC4-R activation and therefore induces weight gain or an oligonuclectide that inhibits translation by encoding an antisense or ribozyme molecule that targets mod4-R transcripts or by forming a triple helix with the MC4-R gene

The sequence is that of a mutant melanocortin 4 receptor (WC4-R), the mutation is the Thr112Met mutation. The sequence can be used in the generation of drug screening assays to identify compounds which could be used in the treatment of body weight disorders e.g. obseity, anorexia and cachexia. Specific compounds include agonists or antibodies that bind and activate the MC4-R to induce weight loss, an antibody or extracelluar domain of the MC4-R that inhibits MC4-R activation and threnefore induces weight gain or an oligonucleotide that inhibits MC4-R ranslation by encoding an antisense or ribozyme molecule that targets MC4-R ranscriptes or by forming a triple helix with the MC4-R gene promoter to induce weight gain. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Drug screening assays to identify compounds for body weight disorder treatment - e.g. obesity, anorexia and cachexia, using melanocortin 4 receptor as target

```
This is a human melanocortin receptor-4 (MC4). The MC4 receptor of this invention is activated by amino acids in the carboxyl and amino terminal portions of the heptapeptide sequence shared by all the melanocortin peptides. MC4 is expressed primarily in brain and is notably absent in the adrenal contex, melanocytes and placenta. The MC4 receptor gene was localised to chromosome local 18021.3. The invention provides methods to identify ligands that bind to MC4 receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a Sulfolobus solfataricus endoglucanase, specifically endo-beta-1,4-glucanase, designated CelB. The new endo-beta-1,4-glucanase is produced by Sulfolobus solfataricus ATCC 35092.
                                                                                                                                                                                                                                                                                                               Gaps
                                                                                     DNA encoding human melanocortin-4 receptor - and cells useful in assay for MC4 receptor ligands

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This is the amino acid sequence of human melanocortin receptor MC4-R, as deduced from the nucleotide sequence of an isolated genomic DNA clone (see AAV63707). MC4-R is a G-protein coupled receptor. The invention relates to the cloning, expression and functional characterisation of mammalian melanocortin receptor. MC1-R, MC2-R, MC3-R, MC4-R and MC5-R nucleic acids (see AAV63702-08) and polypeptides (see AAW8786-70) as well as expression constructs, eukaryotic cells transformed with such constructs, knockout animals, and methods and reagents for developing agonists and antagonists specific for mammalian melanocortin receptors. Such compounds, particularly those specific for MC5-R, are used to treat disorders of exocrine gland function, e.g. of the lacrimal or especies speaked specific down there skin disorders and 'dry eye', also disorders related conditions.

```
This sequence represents the human melanocortin-4 receptor, MC4. This protein is used in a method in which a nucleic acid probe useful for specifically detecting melanocortin-4 receptor genes is described. This probe is used to isolate genes encoding melanocortin receptors, to characterise melanocortin receptor binding and secondary signalling and to determine tissue distribution of the melanocortin receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                         The present sequence represents human melanocortin receptor polypeptide. Melanocortin-1 and melanocortin-2 receptor genes have been localised to chromosome 16424.3 and 18pl.2, respectively. The melanocortin-3 receptor gene has been localised to chromosome loci 20ql3.2 ql3.3. The melanocortin-4 receptor has been localised to chromosome 18q21.3. The melanocortin-3 receptor is activated primarily by the core heptapeptide sequence of melanocortins, with an adjacent terminal tyrosine being required for full activation. The melanocortin receptors and their respective genes are useful in providing therapeutic vehicles for the treatment of processes involving the function of melanocortin receptors. The genes encoding the melanocottin receptors are useful for transfecting mammalian cells lacking endogenous melanocortin receptors to induce
                                                                                                                                                                                                                                           New melanocortin receptor polypeptides MC3 and MC4, and genes encoding the receptors, useful for providing therapeutic vehicles employed in treating disorders involving melanocortin receptor function
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, G protein coupled receptor, GPCR; transmembrane receptor, identification, agonist, screening, therapeutic, pharmaceutical,

Homo sapiens. Synthetic.

mutant.

```
The present invention describes transmembrane receptors, preferably human G protein coupled receptors (GPCR), for which the endogenous highand is unknown (orphan GPCR receptors). More specifically the present invention relates to non-endogenous, constitutively activated versions of a human GPCR. These non-endogenous human GPCRs can be useful for the direct identification of candidate compounds as receptors agonists, inverse agonists or partial agonists for use as pharmaceutical agents. AAA46617 to AAA46126 and AAB02825 to AAB02859 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                  Non-endogenous, human G protein-coupled receptors for screening receptor, inverse or partial agonists useful as therapeutic agents
                                                                                                                                                                                                                                                                                                                        Dang HT;

The present sequence is the rhesus monkey melanoicortin-4

receptor protein (MC-4R). Melanocortin receptors belong to the rhodopsin

sub-family of G-protein coupled receptors. They bind and are

activated by peptides such as alpha-, beta-, or gamma-melanocyte

activated by peptides such as alpha-, beta-, or gamma-melanocyte

are believed to mediate a wide range of physiological functions.

The rhesus MC-4R gene was isolated by PCR using a series of four

oligonucleotides (AAA26973-A26976) based on the human MC-4R gene sequence

and designed to incorporate a restriction enzyme site for cloning into

the expression vector pCI-neo. The recombinant vector was transformed

into DH5a cells in preparation for DNA sequencing. The MC-4R gene

sequence (AAA2692) or a mutated form may be introduced into an

expression vector for expression in host cells. The subcellular

membrane fractions will comprise either wild-type or mutant forms of

rhesus wC-4R at enhanced levels and can be used in assays to identify

ligand binding, activators and modulators, agonists and antagonists of

MC-4R. This will allow for selection of compounds that are active for

the rhesus receptor in vitro and will allow the selection of novel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel DNA encoding rhesus monkey melanocortin 4 receptor protein, recombinant vectors and host cells, useful in methods for identifying selective agonists and antagonists -
                                                                                  Rhesus monkey; rhodopsin; G-protein coupled receptor; anorectic; melanocyte stimulating hormone; melanocortin receptor; obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Melanocortin receptor MC4 comprising Factor Xa cleavage site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 332;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Membrane polypeptide, lipid matrix, syntesis, ligation, chemoselective ligation, fluorescence resonance energy tran FRET; chromophore, ligand; receptor domain; drug screening;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes transmembrane receptors, preferably human G protein coupled receptors (GPCR), for which the endogenous ligand is unknown forphan GPCR receptors). More specifically the present invention relates to non-endogenous, constitutively activated versions of a human GPCR. These non-endogenous human GPCRs can be useful for the direct identification of candidate compounds as receptors agontsts, inverse agonists or partial agonists for use as pharmaceutical agents.

New methods are described by which membrane polypeptides can be labelled. The method comprises chemoselective chemical ligation of the membrane polypeptide which is incorporated in a lipid matrix, and a ligation label. Both contain an amino acid having an unprotected reactive group that together undergo chemoselective injection to form a covalent bond. The method can be used to label folded polypeptides embedded in a lipid membrane, by treating the polypeptide with a reagent that cleaves specifically adjacing the cleaved polypeptide with the ligation label. The ligation label can be detected by contacting a membrane bound polypeptides can be detected by contacting a membrane bound polypeptides can be detected by contacting a membrane bound polypeptides can be detected by detecting fluorescence resonance energy transfer (FRET) between the chromophore and a second chromophore, the chromophores comprising a donor and acceptor pair of a resonance energy transfer (FRET) between the chromophore and a second chromophore, the chromophores comprising a donor and acceptor pair of a resonance energy transfer of the membrane polypeptides are used for lipid matrix-assisted chemical ligation and synthesis of membrane polypeptides. Labeled membrane polypeptides are used to detect ligand correctors or design, and for disagnosis. The methods are particularly used for fluorescent resonance energy transfer (FRET) analysis of stre-specific incorporation of labels during polypeptides. The method allows the sequence of Melanocoxtin receptor MC4 which also comprises a Factor Xa cleavage site. Cleavage with Factor Xa qives a C-terminal alpha-thiosester modified MC4 receptor lightion label produce the membrane polypeptide cleavage produce the membrane patches or micelles to an MC4 ligation label produce the membrane patches or micelles to an MC4 lightion label produce the membrane patches or micelles to an MC4 lightion label produce the membrane patches or micelles. The method and produce membrane patches or micelles to an MC4 lightine
                                                                                                                                                                                                                                                                                         Selectively labeled membrane peptides, useful e.g. for detecting ligand binding to receptors and in drug screening, are prepared, in lipid matrix, by reaction between amino acid residues

New methods are described by which membrane polypeptides can be labelled. The method comprises chemoselective chemical ligation of the membrane polypeptide which is incorporated in a lipid matrix, and a ligation label. Both contain an amino acid having an and a ligation label. Both contain an amino acid having an unprotected reactive group that together undergo chemoselective ligation to form a covalent bond. The method can be used to label colded polypeptides embedded in a lipid membrane, by treating the folded polypeptide with the ligation label. The ligation label can cleaved polypeptide with the ligation label. The ligation label can cleaved polypeptide with the ligation label. The ligation label can be detected with the ligation label. The ligation label can be detected with the ligation label. The ligation label can be detected to contacting a membrane bound polypeptides can be detected with the ligation label. The ligation and screening for chromophore, with the ligation in embrane bound polypeptides can be detected the chromophores comprising a chromophore, the chromophores comprising a donor and acceptor pair of a resonance energy transfer system. The methods are used for lipid anterior and synthesis of membrane polypeptides. Labeled membrane polypeptides are used to detect ligand control and synthesis of for structure/activity studies. They can also be used in drug screening, contaction or design, and for diagnosis. The methods are particularly needed for fluorescent resonance energy transfer (FRET) analysis of previously inaccessible membrane polypeptides are used to detect ligand continues and provides. The methods are particularly and analysis of previously inaccessible membrane polypeptides are used and analysis of previously inaccessible membrane polypeptides are used to deaded and analysis of previously inaccessible membrane provides. The methods such provides and analysis of previously inaccessible membrane polypeptides are used to deaded and analysis of previously inacceptor membrane provides.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to methods for the identification of compounds that regulate addictive behaviour, particularly drug addiction. The method comprises determining whether a test compound can bind to and antagonise a melanocortina to recompound can bind to an animal in order to see if a reduction in addictive compound to an animal in order to see if a reduction in addictive behaviour occurs. Melanocortina are products of pro-opiomelanocortin post-translational processing which are thought to have a broad range of physiological actions, including behaviour, learning, memory, analgesia, thermoregulation and body weight, as well as their well known effects on based on the observations that MC4-R activity potentiates some of the addrenal cortical functions and on melanocytes. The present invention is based on the observations that MC4-R activity potentiates some of the addictive effects of farugs of addiction, particularly occaine and addiction and that knockout mice do not display the behavioural response indicative of addiction caused by chronic and/or acute administration of these drugs. The methods are useful for identifying MC4-R inhibitors. These compounds may be used to treat addiction to a wide variety of substances, including coaine, optates, alcohol, hallucinogens, minor tranquilisers, nicotine and stimulants. The methods are also useful for the treatment of addictive behaviour disorders, including extreme craving, addictive psychological disease or obsessive-compulsive caving disorder. The present sequence represents a mammalian MC4-R.

The specification describes transgenic non-human animals whose somatic and germ cells contain at least one non-functional gene for MC-4R protein. The transgenic animals, or cells derived from them, are used to screen for compounds that modulate MC-4R. These modulators are potentially useful for regulating body weight and food intake and treatment of associated diseases, obesity; diabetes; anorexia; cachexia; cancer; sexual dysfunction; pain; impaired memory or neuronal and insulin-like growth factor-1. They can also be used to study MC-4R expression and activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New transgenic animal with non-functional gene for melanocortin-4 receptor, useful for identifying specific modulators, potentially used for treating obesity or diabetes
                                                                                                                                                                                                                                                Human, melanocortin-4 receptor; MC-R4; transgenic animal; body weight; food intake; obesity; diabetes; anorexia; cachexia; cancer; sexual dyfunction; pain; impaired memory; neuronal regeneration; neuropathy; growth disorder; growth hormone; insulin-like growth factor-1.

Human melanocortin 4-receptor (MC4R)

Human, single nucleotide polymorphism, SNP, melanocortin 4-receptor, MC4R, haplotype, obesity, screening, allele-specific oligonucleotide, ASO, gene therapy, anorectic, chromosome 18q22.

Homo sapiens

Novel polymorphic variants of melanocortin 4-receptor gene useful in studying expression and function of the protein, useful for screening candidate drugs to treat diseases related to the protein activity e.g. obesity

Claim 27; Fig 3; 53pp; English.

The invention relates to single nucleotide polymorphisms (SNP) in human melanocortin 4-receptor (MC4R) gene. MC4R gene haplotypes are useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with MC4R activity, e.g. obesity. MC4R gene is useful in studying the expression and function of MC4R and in expressing MC4R protein for use in screening for candidate drugs to treat diseases related to MC4R activity and in studying the effect of the variation on the biological activity of MC4R as well as on the binding affinity of candidate drugs targetting MC4R for the treatment of obesity. MC4R candidate drugs targetting MC4R for the treatment of obesity. MC4R and in therapeutic methods. Allele specific oligonucleotide (ASO) is useful as probes and primers, and for assaying a polymorphism in MC4R gene. MC4R gene is located on chromosome 18922.

Sequence 8, Application US/08842045
; Patent No. S817787
; GENERAL INFORMATION:
APPLICANT: Yamada, Tadataka
; TITLE OF INVENTION: Genes Encoding Melanocortin Receptors
TUTHE OF INVENTION: Genes Encoding Melanocortin Receptors
NUMBER OF SEQUENCES:
CORRESPONDENCE ADDRESS:
STREET: P.O. Box 828
CITY: Bloomfield Hills
STREET: M. ...
Length 332;
                                               0; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        COMPUTER READABLE FORM:

ZIP: 48303

COMPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

US-08-870-511-10

SEQUENCE 10, Application US/08870511

Patent No. 6287763

GENERAL INFORMATION:
APPLICANT: Lee, Frank
APPLICANT: Huszar, Dennis
APPLICANT: Gu, Wei
TITLE OF INVENTION: SCREENING METHODS FOR COMPOUNDS USEFUL IN THE
TITLE OF INVENTION: REGULATION OF BODY WEIGHT
FILE REFERENCE: 783-083

CURRENT APPLICATION NUMBER: US/08/870,511

CURRENT FILING DATE: 1997-06-06

NUMBER OF SEQ ID NOS: 45

SOFTHARE: PatentIN Ver. 2.0

SEQ ID NO 10

LENGTH: 332

TYPE: PRT

TYPE: REPERENCE: 180-06-06

SEQ ID NO 10

LENGTH: 332

TYPE: RT

CORGANISM: Homo sapiens

Sequence 6, Application US/09384302A

Sequence 6, Application US/09384302A

Patent No. 6451543

CRERAL INFORMATION:
APPLICANT: Kochendoerfer, Gerd G
APPLICANT: Hunter, Christie L
APPLICANT: Hunter, Christie L
APPLICANT: Stain Staiences
TITLE OF INVENTION: Lipid Matrix-Assisted Chemical Ligation and Synthesis
TITLE OF INVENTION: Lipid Matrix-Assisted Chemical Ligation and Synthesis
TITLE OF INVENTION: Lipid Matrix-Assisted Chemical Ligation and Synthesis
TITLE OF INVENTION: Lipid Matrix-Assisted Chemical Ligation and Synthesis
TITLE OF INVENTION: 0f Membrane Polypeptides
FILE REFERENCE: grfn-028/02W

CURRENT PILING DATE: 1999-08-26

PRIOR APPLICATION NUMBER: 09/144,964

PRIOR FILING DATE: 1999-08-26

PRIOR PILING DATE: 1999-03-05

NUMBER OF SEQ ID NOS: 30

SOFTWARE: PatentIn Ver: 2.1

SEQ ID NO 6

LENGTH: 332

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                 141

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Alternate names: mitochondrial outer membrane preprotein receptor chain MOM22
N.Alternate names: mitochondrial outer membrane preprotein receptor chain MOM22
S.Species Neurospora crassa
C.Date: 03-May-1994 #sequence_revision 02-Jun-1994 #text_change 22-Jun-1999
C.Accession: A40669; S33472
C.Bate: N. Katl, P.; Schneider, H.; van der Klei, I.J.; Pfanner, N.; Neupert, W.
Cell 74, 483-492, 1993
A.Title: The mitochondrial receptor complex: a central role of MOM22 in mediating preprody. The mitochondrial receptor complex: a central role of MOM22 in mediating preprody. The second of the mitochondrial receptor complex: a central role of MOM22 in mediating preprody. A.Reference number: A40669; MUID:93351229; PMID:8348615

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cispecies: Salmonella enterica subsp. enterica serovar Typhi
Ainote: this species has also been called Salmonella typhi
Cipacession: AH0552
Becies has also been called Salmonella typhi
Cipacession: AH0552
Becies has also been called Salmonella typhi
Cipacession: AH0552
Becies has also been called Salmonella town-2002
Cipacession: AH0552

MAX12 protein - yeast (Saccharomyces cerevisiae)

N.Alternate names: protein YCR019w
C.Specias: Saccharomyces cerevisiae
C.Specias: Saccharomyces cerevisiae
C.Specias: Saccharomyces cerevision
C.Accession: S19429; S07695

R.Feldmann, H.; Mannhaupt, G.; Vetter, I.
Submitted to the Protein Sequence Database, March 1992
R.Reference number: S19429
A.Molecule type: DNA
A.Residues: 1-363 cFEL>
A.Molecule type: DNA
A.Residues: 1-363 cFEL>
A.Rocession: S19429
A.Molecule type: DNA
A.Residues: 1-36-171, 1985
A.Title: The PET18 locus of Saccharomyces cerevisiae: a complex locus containing multify Residues: 1-14, I1, 15-81, 83-282, 'S', 284-363 cTOH>
A.Rocession: S07692
A.Molecule type: DNA

membrane proteins homolog lmo0908 [imported] - Listeria monocytogenes (strain EGD-e)

membrane proteins homolog lmo0908 [imported] - Listeria monocytogenes

C;Species: Listeria monocytogenes

C;Species: Listeria monocytogenes

C;Accession: ADI188

R;Glaser, P.; Frangeul, L.; Buchrieser, C.; Amend, A.; Baquero, F.; Berche, P.; Bloecker, pominguez-Bernal, G.; Duchaud, E.; Durand, L.; Dussurget, O.; Entian, K.D.; Fsihi, P.; Jones, L.M.; Karst, U.

Science 294, 849-852, 2001
